and tails TOUCH the
barriers.**

**Change EMA value to suit
current market conditions.**

Pre Market: Price moved in consolidation channel for almost an hour; 8 a.m. to about 8:45. R1 top; order flow volume mid range marker; through order flow volume low range market to bottom of MLTRSD support box.

Most **POTENT** attractors of price are **Y-Settlement / 200 SMA / Y-High**.

At 8:40 it was a viable conclusion that when the Crude Pit opened the price would likely FINALLY find its way down to touch Y-Settlement. Instead, market makers pushed the price up to the R1 about 10 minutes before pit open and when Pit Traders came in they helped the price complete the journey to the 200 SMA and then back down to the R1.

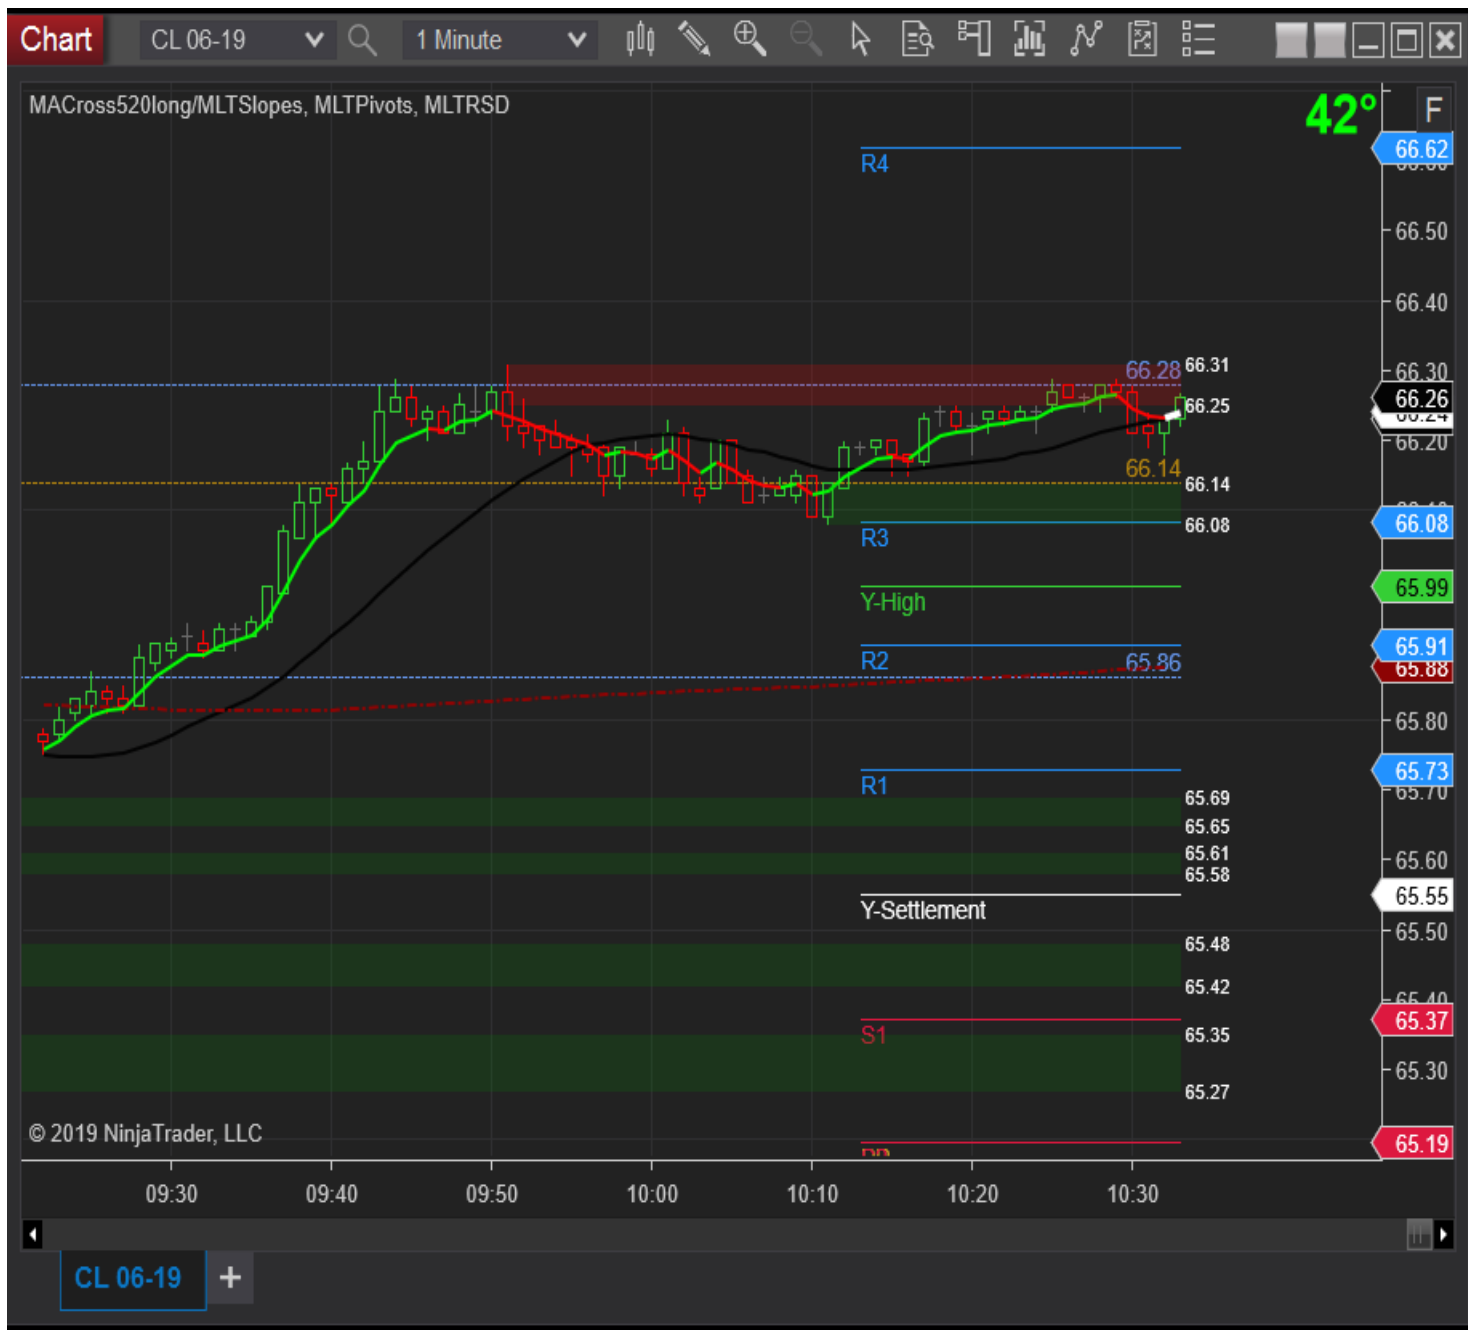

5-20 Cross shortly after 9:20. First stop 200 SMA. Two minutes sideways. Next stop R2 and mid range marker of Order Flow Volume indicator. Three minutes sideways. Next stop Y-High and then immediately on to R3 and the top of Order Flow Volume indicator range as well as the resistance area plotted by the MLTRSD indicator.

CAN YOU LEARN TO BE PREDICTIVE??

Price hits a “ceiling” and then moves into a consolidation channel.

Look at “wicks and tails” on the candles and tell me which indicator is more accurate:

Masterline Traders MLTRSD

The NinjaTrader Order Flow Volume Indicator??
